

Fall 2008  
International Corporate Finance I

LECTURE 3 & 4  
**Basic Theory of Interest  
and Project Valuation**

Tokuo Iwaisako  
HITOTSUBASHI UNIVERSITY

8/28/2008

ICU08\_lecture3: Present Value

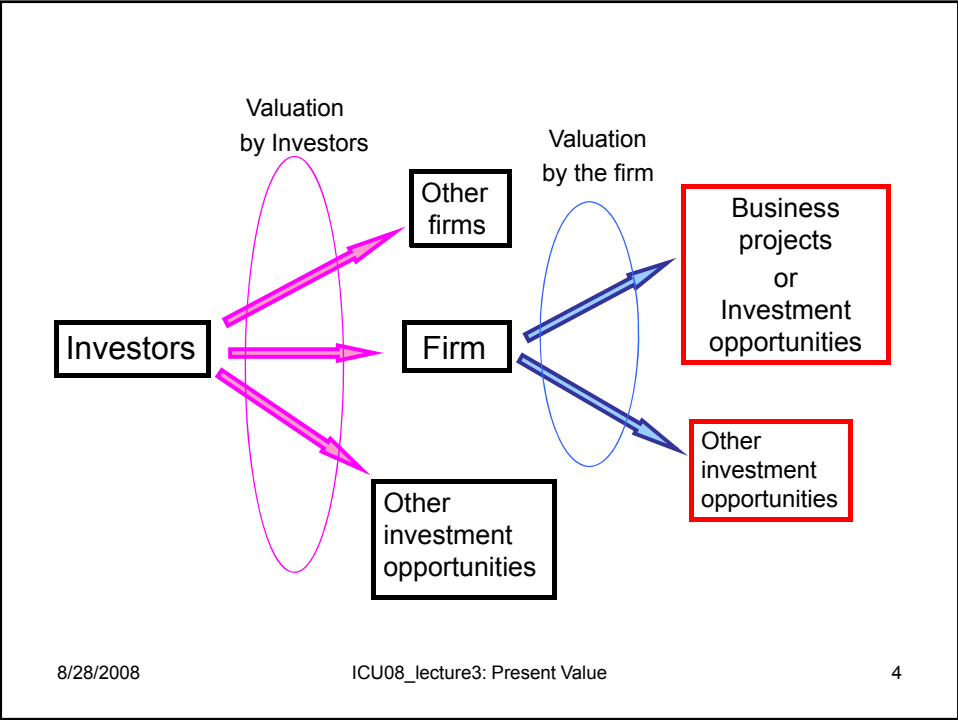

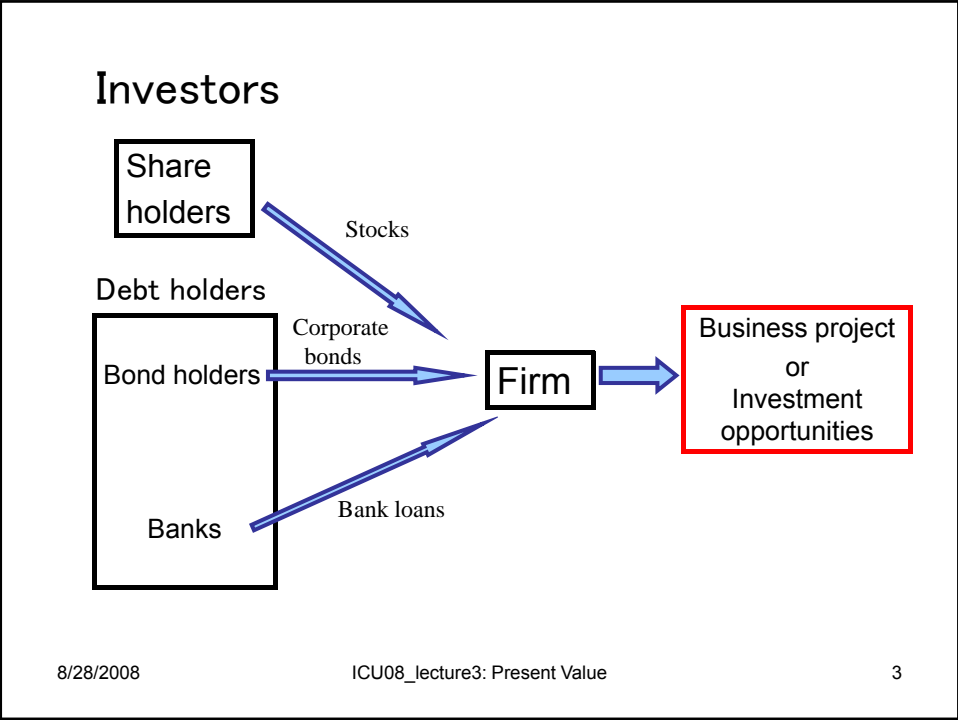

1

**Part 1:**  
Firm's investment decision making  
and  
present value principle

8/28/2008

ICU08\_lecture3: Present Value

2

## Valuation of business project(s): Examples

- Business project that requires \$1 million initial investment
  - \$1.2 million profits in one year
  - \$1.5 million profits in five years
  - Should the firm invest to such investment opportunities?
- Mutually exclusive projects
  - \$1.2 million profits in one year
  - \$1.5 million profits in five years
  - To which project should the firm invest?

8/28/2008

ICU08\_lecture3: Present Value

5

## How should we determine the value of the investment opportunity?

- **Present-value principle**
  - Or **discounted present value**
- “Discount” future earnings and costs.
- Evaluate them in the values today.

8/28/2008

ICU08\_lecture3: Present Value

6

## Investing to a project or buying government bonds?

- How much will you pay for the claim (=bond) that pays  $\$1$  after one year?
  - Suppose people are willing to pay  $\$Y$  for the bond.
- There is the project that pays out  $\$X$  after one year.
- Investing to this project is same as buying  $X$  units of the bonds.

8/28/2008

ICU08\_lecture3: Present Value

7

## Discounting

- Buying  $X$  units of bonds costs  $\$XY$  today.
- Hence, the project should cost  $\$XY$  too.
- Alternatively, let  $D=1/Y$  and  $1+d=D$ .
- Then the project should costs:  $X/(1+d)$ .
  - “ $D$ ” is called a “discount factor.”
  - “ $d$ ” is called a “discount rate.”

8/28/2008

ICU08\_lecture3: Present Value

8

## Part 2: Basic Theory of Interest

8/28/2008

ICU08\_lecture3: Present Value

9

### Basic theory of interest (1)

- The case of bank deposit
- Deposit **\$100** today.
  - Interest rate is **1%**  $\Rightarrow r = 1\% = 0.01$
  - After one year: \$101 in bank account  
(= **\$100 x 1.01**)

8/28/2008

ICU08\_lecture3: Present Value

10

## Basic theory of interest (2)

- The case of government (riskless) bond
- The claim for receiving **\$100** after one year from today (the maturity of the bond is one year)
  - Face value:  $P_1 = \$100$
  - Bond price:  $P_0 = \$99.01$
  - Interest rate:  $r = P_1 / P_0 - 1 = 0.01$

8/28/2008

ICU08\_lecture3: Present Value

11

## Basic theory of interest (3)

- Algebraic representation
  - Bank deposit:  $(1+r)P_0=P_1$
  - Bond:  $P_1/P_0=1+r$  or  $(P_1-P_0)/P_0=r$
- $P_0, P_1, r$ : If two of them were given, the remaining is automatically determined.
- “Bond price” and “interest rate” have a one-on-one relationship.

8/28/2008

ICU08\_lecture3: Present Value

12

## Basic theory of interest (4)

- Economic interpretation
  - Face value  $P_1$  is given and fixed
  - Suppose bond price  $P_0$  goes up.
  - Today's price of " $P_1$  yen in future" goes up.
  - Interest rate goes down.
- Interest rate: relative price of future cash in terms of today's money

8/28/2008

ICU08\_lecture3: Present Value

13

## Two views on bond / loan market

	Issuing bond, bank borrowing	Financial asset
What is traded	Funds	Payoff at maturity
Demand side	Firm	Investor
Supply side	Investor / creditor	Firm
Price	Interest rate	Bond price

8/28/2008

ICU08\_lecture3: Present Value

14

## Basic theory of interest multi-period case (1)

- Compounding
- $P_T = P_0(1+r_1)(1+r_2)(1+r_3)\dots(1+r_T)$
- Suppose  $r_i = \text{constant}$  for  $i=1, 2, \dots, T$
- $P_T = P_0(1+r)^T$  or  $P_0 = P_T/(1+r)^T$

8/28/2008

ICU08\_lecture3: Present Value

15

## Basic theory of interest multi-period case (2)

- Coupon payment:  $C_t$
- One period case:  $P_0 = (P_1 + C_1)/(1+r)$
- Multi-period case

$$P_0 = \frac{C_1}{1+r} + \frac{C_2}{(1+r)^2} + \frac{C_3}{(1+r)^3} + \dots + \frac{P_T}{(1+r)^T}$$

8/28/2008

ICU08\_lecture3: Present Value

16

## Notes on compounding

- Convenient approximation
  - $\ln(A)$  = Natural log of A
  - If the absolute value of  $x$  was very small,  
 $\ln(1+x) \sim x$
  - $\ln(XY) = \ln(X) + \ln(Y)$
- Let  $P_2 = P_0(1+r_1)(1+r_2)$  and  $P_2/P_0 = 1+R$ 
  - $\ln((1+r_1)(1+r_2)) = \ln(1+r_1) + \ln(1+r_2) \sim r_1 + r_2$
  - Thus  $R \sim r_1 + r_2$

8/28/2008

ICU08\_lecture3: Present Value

17

## Part 3: Back to investment problem

8/28/2008

ICU08\_lecture3: Present Value

18

## Present value principle: general formula

$$P_0 = \frac{C_1}{1+r} + \frac{C_2}{(1+r)^2} + \dots + \frac{P_T + C_T}{(1+r)^T}$$

$$\text{But, } P_T = \frac{P_{T+1} + C_{T+1}}{1+r}$$

$$P_0 = \frac{C_1}{1+r} + \frac{C_2}{(1+r)^2} + \dots + \frac{C_T}{(1+r)^T} + \frac{P_{T+1} + C_{T+1}}{(1+r)^{T+1}}$$

$$\Rightarrow P_0 = \sum_{j=1}^{\infty} \frac{C_j}{(1+r)^j}$$

8/28/2008

ICU08\_lecture3: Present Value

19

## What is “ $C_t$ ”? What is “ $T$ ”?

- If stock:  $C_t$  is dividend payments
- If real estate:  $C_t$  is rent payments
- If bond:  $C_t$  is coupon payments
  
- Terminal period,  $T$
- If bond:  $T$  is finite (e.g.  $T = 1, 5, \dots, 10$  years)
- Stocks and real estates:  $T$  is infinite

8/28/2008

ICU08\_lecture3: Present Value

20

## Some useful formula (1)

- Annuity
  - financial asset that pays constant amount every period:  $C = C_1 = C_2 = C_3 = \dots = C_T$
  - Discount rate is constant:  $r$
- Perpetuity:  $T \rightarrow$  infinity

$$P_0 = \frac{C}{1+r} + \frac{C}{(1+r)^2} + \frac{C}{(1+r)^3} + \dots$$

$$\Rightarrow P_0 = \frac{C}{r}$$

8/28/2008

ICU08\_lecture3: Present Value

21

## Some useful formula (2)

- Growing perpetuity/Growing Gordon formula
  - $C$  grows every period at the rate of “ $g$ ”:  
 $C_1 = (1+g)C_0$

$$P_0 = \frac{C}{1+r} + \frac{(1+g)C}{(1+r)^2} + \frac{(1+g)^2 C}{(1+r)^3} + \dots$$

$$\Rightarrow P_0 = \frac{C}{r-g}$$

8/28/2008

ICU08\_lecture3: Present Value

22

## Discounting future cash-flows of the business project

- Suppose a project generates cash flow stream,  $C_0, C_1, C_2, \dots, C_T$ .  
–  $C_t$  = “Period  $t$  sales” - “Period  $t$  costs”
- We discount future cash flows by the government bond interest rate.

8/28/2008

ICU08\_lecture3: Present Value

23

## Comparison with the investment to government bond

- Discounted cash flow (DCF) of the project

$$DCF_{PRJ} = C_0 + \frac{C_1}{1+r} + \frac{C_2}{(1+r)^2} + \frac{C_3}{(1+r)^3} + \dots$$

- Investment to JGB:  $C_0 = -P_0$ ,  $C_1 = P_1 = (1+r)P_0$

$$DCF_{JGB} = -P_0 + \frac{P_1}{1+r} = -P_0 + \frac{(1+r)P_0}{1+r} = 0$$

8/28/2008

ICU08\_lecture3: Present Value

24

Take “investment to JGB” as a benchmark

8/28/2008

ICU08\_lecture3: Present Value

25

## Valuation by present-value principle

- If  $DCF_{JGB} < DCF_{PRJ}$ , then the firm should invest to the project.
- But, always  $DCF_{JGB} = 0$ . Thus, the firm should invest to the project only if  $DCF_{PRJ} > 0$ .
- $DCF_{PRJ}$  is the present-value of the project when it is evaluated with appropriate discount rate  $r$ .

8/28/2008

ICU08\_lecture3: Present Value

26

## Important preservations

- In our discussions so far, we have completely ignored any “risk.”
- If there is any risk, we have to assume risk neutrality.
- “Risk neutral” = investors care only expected payoffs, do not care its variance.
- Otherwise, we have to explicitly incorporate “the price of risk” or “risk premium” into the analysis. -  
-- We will do this latter.

8/28/2008

ICU08\_lecture3: Present Value

27

## Comparing multiple projects

Choosing one of mutually exclusive projects.

	0	1	2	Total
Project 1	-7	11	12.1	16.10
Project 2	-1	22	-12.1	8.90
Project 3	-5	44	24.2	63.20
Project 4	-1	11	0	10.00

8/28/2008

ICU08\_lecture3: Present Value

28

## Different discount rates and present value

	Cash flow			Discount rate	PV
	0	1	2		
				<b>10%</b>	
Project 1	-7	11	12.1	0.10	13
Project 2	-1	22	-12.1	0.10	9
Project 3	-5	44	24.2	0.10	55
Project 4	-1	11	0	0.10	9

8/28/2008

ICU08\_lecture3: Present Value

29

	Cash flow			Discount rate	PV
	0	1	2		
				<b>20%</b>	
Project 1	-7	11	12.1	0.20	10.56944
Project 2	-1	22	-12.1	0.20	8.930556
Project 3	-5	44	24.2	0.20	48.47222
Project 4	-1	11	0	0.20	8.166667

	Cash flow			Discount rate	PV
	0	1	2		
				<b>30%</b>	
Project 1	-7	11	12.1	0.30	8.621302
Project 2	-1	22	-12.1	0.30	8.763314
Project 3	-5	44	24.2	0.30	43.16568
Project 4	-1	11	0	0.30	7.461538

8/28/2008

ICU08\_lecture3: Present Value

30

## Part 4: Valuation by arbitrage

8/28/2008

ICU08\_lecture3: Present Value

31

## Arbitrage and present-value relations

- No arbitrage condition = law of one price
  - hamburger + cola + potato
  - The set of three and buying them individually should cost the same.
- Application of “No arbitrage condition”
- Using zero-coupon bond price to price coupon bonds.
- The price of zero-coupon bond that matures at time  $T$  = The price of cash in period  $T$ .

8/28/2008

ICU08\_lecture3: Present Value

32

## An application: Pricing coupon bonds

- Face value: **\$100**  
Maturity: **36** months  
Coupon: **\$5** yen coupon payment at **12** months and **24** months later.
- Data (Face value = **100 thousand**)
  - Zero-coupon bond price (**T=12** months): **97.5**
  - Zero-coupon bond price (**T=24** months): **94.3**
  - Zero-coupon bond price (**T=36** months): **90.7**

8/28/2008

ICU08\_lecture3: Present Value

33

## Replicating payoffs of the coupon bond using zero-coupon bonds

- **$Y_{12}=5, Y_{24}=5, Y_{36}=100$**
- Zero-coupon bond (**T=12**): **0.05** units
- Zero-coupon bond (**T=24**): **0.05** units
- Zero-coupon bond (**T=36**): **1** unit
- This synthetic coupon bond has exactly same payoff pattern.

8/28/2008

ICU08\_lecture3: Present Value

34

## Theoretical value of coupon bond price

- $97.5 \times 0.05 + 94.3 \times 0.05 + 90.7 \times 1$   
 $= 4.875 + 4.715 + 90.7$   
 $= 100.29$
- Theoretical value: **\$100.29**

8/28/2008

ICU08\_lecture3: Present Value

35

## A digression

- How risk-free interest rate will be determined?
- Simple answer: “Demand and supply”
- Demand and supply of what?

8/28/2008

ICU08\_lecture3: Present Value

36

## Remember...

There are two views on bond / loan market

	Issuing bond, bank borrowing	Financial asset
What is traded	Funds	Payoff at maturity
Demand side	Firm	Investor
Supply side	Investor / creditor	Firm
Price	Interest rate	Bond price

8/28/2008

ICU08\_lecture3: Present Value

37

## Bond market equilibrium: Equilibrium bond price and interest rate

8/28/2008

ICU08\_lecture3: Present Value

38

## Relation between bond price and its interest rate

- Face value  $P_1$  is given and fixed
  - Suppose bond price  $P_0$  goes up.
  - Today's price of "P<sub>1</sub> yen in future" goes up.
  - Interest rate goes down.
- Interest rate: relative price of future cash in terms of today's money

8/28/2008

ICU08\_lecture3: Present Value

39

## Demand for bond = supply of loans

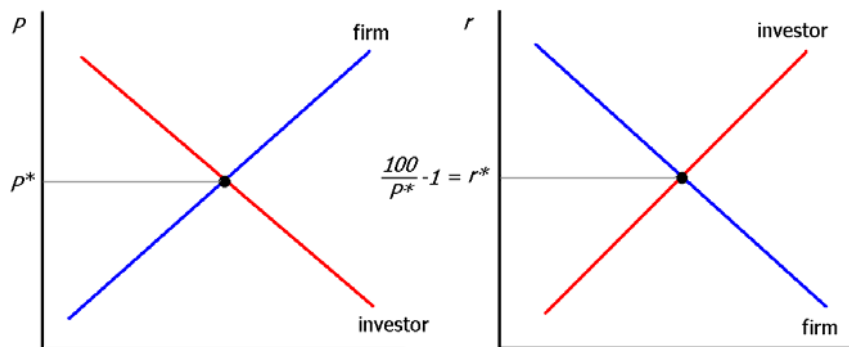

8/28/2008

ICU08\_lecture3: Present Value

40

## Demand for bond by lenders

8/28/2008

ICU08\_lecture3: Present Value

41

## Supply of bond = demand for loans

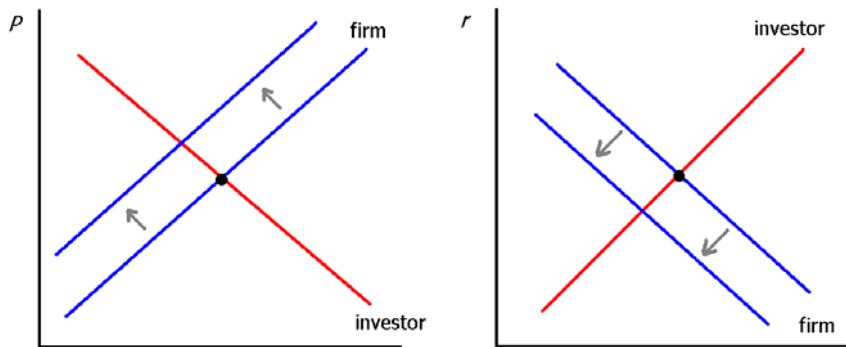

8/28/2008

ICU08\_lecture3: Present Value

42

Eg. Expected profitability falls  
→ Bond price will increase

8/28/2008

ICU08\_lecture3: Present Value

43

## Factors shift supply curve for bonds

- Corporate tax on profit
- Tax subsidies for investment
- Expected inflation
- Government borrowing

8/28/2008

ICU08\_lecture3: Present Value

44

## Factors shift demand curve for bonds

- Investors wealth
- Expected returns on bonds
- Expected returns on other assets
- Riskiness of bonds relative to other assets
- Expected inflation
- Liquidity of bonds relative to other assets

8/28/2008

ICU08\_lecture3: Present Value

45

## Methodology of arbitrage pricing

- You have an asset (or business project) that you would like to price. Check the payoff pattern of your asset.
- Replicate the payoff pattern of the asset using existing assets. Construct the replicating portfolio.
- The valuation of an asset must be equal to the value of assets used to construct the replicating portfolio.

8/28/2008

ICU08\_lecture3: Present Value

46

## Use tracking portfolio to value investment projects

- Find some asset or combination of assets that perfectly tracks the cash flows of the investment project.
- Apply no-arbitrage condition.
- The price of a tracking portfolio is the value of the investment project.

8/28/2008

ICU08\_lecture3: Present Value

47

## Limit of tracking portfolio approach

- For example, oil price can be used to price oil well.
- However, there will not be a perfectly replicating portfolio in practice. There are always tracking errors.
- If there are significant tracking errors, use asset pricing models.  
→ Theme of the next lecture.

8/28/2008

ICU08\_lecture3: Present Value

48
